

Simulations

Thursday, November 1st 2007:

SIGNALSOFT Rail Consultancy Ltd. is proud to announce their new Signal Tower Simulation series.

In this first series of simulations we concentrate on NX type panels from GRS (General Railway Signals). Now owned by Alstom, GRS produced those early All Relay interlockings and besides selling them to US based railroad companies, GRS sold them also to the Netherlands Railways.

Those kind of NX Panels were in use until 2002.

SIGNALSOFT Rail Consultancy Ltd. will publish these simulations for the purpose of "Documenting Technical History".

The first in the row of Signal Tower Simulations will be "Post T Arnhem". Arnhem is a truly bottleneck for railways. Lots of crossing traffic, international trains (TEE!) and a very busy junction with an adjacent single line bridge will challenge all dispatching tricks you know of!

More information will be submitted soon.
